## Naive Bayes

Total points 10

1. Assume that there are 2 happy people and 2 unhappy people in a room. Concretely, persons A and B are happy and persons B and C are unhappy. If you were to randomly pick a person from the room, what is the probability that the person is happy.

1 / 1 point

☒ 1/2

☐ 1/4

☐ 3/4

☐ 0

✔ Correct

2. Assume that there are 2 happy people and 2 unhappy people in a room. Concretely, persons A and B are happy and persons B and C are unhappy. If a friend showed you the part of the room where the two happy people are, what is the probability that you choose person B?

1 / 1 point

☒ 1/2

☐ 1/4

☐ 3/4

☐ 1

✔ Correct

3. From the equations presented below, express the probability of a tweet being positive given that it contains the word happy in terms of the probability of a tweet containing the word happy given that it is positive

1 / 1 point

$$P(\text{Positive} \mid \text{"happy"}) = \frac{P(\text{Positive} \cap \text{"happy"})}{P(\text{"happy"})}$$

$$P(\text{"happy"} \mid \text{Positive}) = \frac{P(\text{"happy"} \cap \text{Positive})}{P(\text{Positive})}$$

☒  $P(\text{Positive} \mid \text{happy}) = P(\text{happy} \mid \text{Positive}) \times \frac{P(\text{Positive})}{P(\text{happy})}$

☐  $P(\text{Positive} \mid \text{happy}) = P(\text{"happy"} \mid \text{Positive}) \times \frac{P(\text{happy})}{P(\text{Positive})}$

☐  $P(\text{Positive} \cap \text{happy}) = P(\text{happy} \mid \text{Positive}) \times \frac{P(\text{Positive})}{P(\text{happy})}$

☐  $P(\text{Positive} \cap \text{happy}) = P(\text{"happy"} \mid \text{Positive}) \times \frac{P(\text{happy})}{P(\text{Positive})}$

✔ Correct

Yes, that is the correct answer.

4. Bayes rule is defined as

1 / 1 point

- ☒  $P(X | Y) = P(Y | X) \times \frac{P(X)}{P(Y)}$
- ☐  $P(X | Y) = P(Y | X) \times \frac{P(Y)}{P(X)}$
- ☐  $P(X | Y) = P(X | Y) \times \frac{P(X)}{P(Y)}$
- ☐  $P(X | Y) = P(Y | X) \times \frac{P(X)}{P(Y|X)}$

✓ Correct  
Yes.

5. Suppose that in your dataset, 25% of the positive tweets contain the word 'happy'. You also know that a total of 13% of the tweets in your dataset contain the word 'happy', and that 40% of the total number of tweets are positive. You observe the tweet: 'happy to learn NLP'. What is the probability that this tweet is positive?

1 / 1 point

0.77

✓ Correct  
\*\*\*\* That's right. You just applied Bayes' rule.

6. The log likelihood for a certain word  $w_i$  is defined as:

1 / 1 point

$$\log\left(\frac{P(w_i|pos)}{P(w_i|neg)}\right).$$

☒ Positive numbers imply that the word is positive.

✓ Correct

☐ Positive numbers imply that the word is negative.

☒ Negative numbers imply that the word is negative.

✓ Correct

☐ Negative numbers imply that the word is positive.

7. The log likelihood mentioned in lecture, which is the log of the ratio between two probabilities is bounded between

1 / 1 point

- ☐ -1 and 1
- ☒  $-\infty$  and  $\infty$
- ☐ 0 and  $\infty$
- ☐ 0 and 1

✓ Correct  
Yes!

8. When implementing naive Bayes, in which order should the following steps be implemented.

1 / 1 point

- ☒ 1. Get or annotate a dataset with positive and negative tweets
- 2. Preprocess the tweets: `process_tweet(tweet)` →
- 3. Compute `freq(w, class)`
- 4. Get  $P(w \mid \text{pos})$ ,  $P(w \mid \text{neg})$
- 5. Get  $\lambda(w)$
- 6. Compute  $\text{logprior} = \log(P(\text{pos}) / P(\text{neg}))$
- ☐ 1. Get or annotate a dataset with positive and negative tweets
- 2. Preprocess the tweets: `process_tweet(tweet)` →
- 3. Compute `freq(w, class)`
- 4. Get  $\lambda(w)$
- 5. Get  $P(w \mid \text{pos})$ ,  $P(w \mid \text{neg})$
- 6. Compute  $\text{logprior} = \log(P(\text{pos}) / P(\text{neg}))$
- ☐ 1. Get or annotate a dataset with positive and negative tweets
- 2. Compute `freq(w, class)`
- 3. Preprocess the tweets: `process_tweet(tweet)` →
- 4. Get  $P(w \mid \text{pos})$ ,  $P(w \mid \text{neg})$
- 5. Get  $\lambda(w)$
- 6. Compute  $\text{logprior} = \log(P(\text{pos}) / P(\text{neg}))$
- ☐ 1. Get or annotate a dataset with positive and negative tweets
- 2. Compute `freq(w, class)`
- 3. Preprocess the tweets: `process_tweet(tweet)` →
- 4. Compute  $\text{logprior} = \log(P(\text{pos}) / P(\text{neg}))$
- 5. Get  $P(w \mid \text{pos})$ ,  $P(w \mid \text{neg})$
- 6. Get  $\lambda(w)$

✓ Correct

Yes, that is correct.

9. To predict using naive bayes, which of the following are required.

1 / 1 point

- ☒  $X_{val}, Y_{val}, \lambda, \text{logprior}$

☐  $X_{val}, Y_{val}, \logprior$

☐  $X_{val}, \lambda, \logprior$

☐  $Y_{val}, \lambda, \logprior$

**Correct**

This is correct.

10. Which of the following is NOT an application of naive Bayes?

1 / 1 point

☐ Sentiment Analysis

☐ Author identification

☐ Information retrieval

☐ Word disambiguation

☒ Numerical predictions

**Correct**

This is correct.
